SUSTAINABLE PRODUCT DESIGN AND DEVELOPMENT VISION STATEMENT

Introduction

Intertape Polymer Group Inc.'s (IPG) vision is to be the global leader in packaging and protective solutions.

This vision will be accomplished through adopting efficient design criteria to maximize product material safety and incorporate product circularity principles. IPG has adopted a Sustainable Product Design and Development Vision which places the precautionary principle, as outlined in the United Nations Global Compact, and the Cradle to Cradle® design principles, as central pillars to guide our aspirational sustainable product lifecycle goals.

The following sustainable product design criteria and development guidelines are used throughout the enterprise wherever and whenever possible:

1. Make "Safe and Circular" the ultimate goal for all new product development.
2. Measure and assess our products per the Cradle to Cradle Certified® Product Standard. Target Cradle to Cradle Certified® Product Standard Silver status for new products and assess our current product lines to implement measures to achieve Silver status for current products.
3. Eliminate the use of toxic substances from new and existing products, as well as our manufacturing processes.
4. Incorporate recycled and renewable materials in product design and purchasing to promote circularity.
5. Maximize efficiency of raw material usage without compromising the integrity and function of the product.
6. Improve the recyclability of existing products and design with an aspirational goal of 100% circular.
7. Investigate and improve social and environmental impacts across the lifecycle of all products and design products to facilitate positive impacts through the rest of the supply chain.

In addition to above guidelines, IPG will continue to comply with all applicable federal, state, local and country specific regulations.
